Quant Rule - Kata

Description

A research system that discovers and evaluates potential trading edges in historical market data. Its purpose is to distinguish repeatable statistical advantages from randomness and overfitting.

Users

Individual quantitative researcher developing and evaluating trading strategies.

Requirements

1. Define and record market hypotheses.
2. Explore historical data to identify potential predictive signals.
3. Account for transaction costs and market conditions.
4. Measure statistical significance and expected returns.
5. Validate hypotheses using out-of-sample data.
6. Compare experiments and reproduce previous results.

Additional context

The system is a research tool, not an execution platform. Its primary goal is to establish whether an apparent market advantage is statistically meaningful, robust, and worth further investigation.
