QuantRule - Project Overview

QuantRule

2026-11-12

Project. A research workstation that turns an OHLCV hypothesis into reproducible, cost-aware evidence.

Who. One quantitative researcher. One reviewer who reproduces a result.

What exists today. A working deterministic pipeline in the v0.3.0 tree: data, model, strategy, execution, portfolio, backtest, qualification, analytics, and a command shell. A distributed platform (six services, one image, browser client, desktop shell) is being built on top of it; three of six foundation issues are merged.

How it is judged. The same candles and configuration produce the same bytes; a reviewer compares one digest; a negative result is a valid outcome.

Constraint that shapes everything. One operator, one machine or a small internal server. No accounts, no cloud runtime.
